

Two-hour horizon: our model tracks the real envelope more closely than the TRADES default

INTC 2015-01-29, 10:00-12:00. The published sampling default (DDPM, 100 steps, no decode-time correction) runs

3.2x the real one-second volatility (4.04 bp vs 1.26 bp); the adopted configuration runs 1.65 bp.
